## **Table of Contents**

# 1 Licence, Requirements and README

Permission is granted to copy, distribute and/or modify this software under the terms of the LTEX Project Public License (LPPL), version 1.3c or later (http://www.latex-project.org/lppl.txt). The software has the status "maintained."

XSIM loads the packages expl3 [bnd:l3kernel], xparse [bnd:l3packages], etoolbox [pkg:etoolbox], array [pkg:array] booktabs [pkg:booktabs] and translations [pkg:translations]. All of these packages are present on a modern and up to date TeX distribution such as TeX Live or MiKTeX so no further action should be needed. When you are using xsim you should be using an up to date TeX distribution, anyway.

Please be aware that **xsim** is in an experimental state and actively developed. Many aspects may change from one update to another until a stable version 1 will be reached. However, I will try my best to keep the interface stable.

Newer versions of **XSIM** may depend on newer versions of the support packages. Remember: it is always dangerous to update single packages. Always update your TEX distribution if you want an up to date version of a package. Be careful: if you're in the middle of an important project it might be better to wait with the update until you've finished the project. Every update might be breaking some things.

I'm currently thinking to make the option no-files the default behavior of xsim. There is a poll and discussion regarding this question on xsim's github page if you like to give your opinion on this.

The whole collection mechanism is likely to change completely in the not-so-far future (let's say sometime in the six months from April 2020 or so).

# 2 Motivation, Background

It has been quite a while since I first published exsheets [**pkg:exsheets**] in June 2012. Since then it has gained a user base and a little bit of popularity as the number of questions on tex.sx shows (143 at the time of writing) [**texsx:tagged/exsheets**]. User questions, bug reports and feature requests improved it over the time. It still has a version number starting with a zero, though, which in my versioning system means I still consider it experimental.

This is due to several facts. It lacks a few features which I consider essential for a full version 1. For one thing it is not possible to have several kinds of exercises numbered independently. Using verbatim material such as listings inside exercises and solutions is not possible and the current workaround isn't that ideal either. One request which dates back quite a while now was to have different types of points to exercises...

All of those aren't easy to add due to the way exsheets is implemented right now. As a consequence I wanted to re-implement exsheets for a long time. This is what lead to **xsim**. Internally the package works completely different.

**XSIM** will be the official successor of exsheets which is now considered obsolete but will stay alive and will still receive bugfix releases. However, new features will not be added to exsheets any more.

## 3 How to Read the Manual

#### 3.1 Nomenclature

Throughout this manual certain terms are used. This section explains their meaning in this manual.

## 3.2 Package Options

**XSIM** has these package options:

#### verbose

Writes extensive information about what **XSIM** is doing into the log file.

#### final

If used the exercise and solution environments will not rewrite the environment body files.

#### clear-aux

If used every time the total number of exercise changes **XSIM** will write *less* information to the auxiliary file on the next run and only if the number of exercises stays stable between compilations the needed information will be written to the auxiliary file. *This needs more compilations until everything stabilizes but should reduce the probability of possibly faulty exercises after changes to the document. The final option automatically disables this option. See also sections ?? and ??.* 

no-files Default: true

This option prevents XSIM from writing the exercises and solutions to external files. This will keep working folder "clean" but will also prevent using verbatim material in exercises and solutions.

#### use-files

This is the ropposite of the option no-files.

(Jan 1, 2021)

use-aux

Withothis option enabled XSIM will use the regular auxiliary file \jobname.aux instead of its own auxiliary file \jobname.xsim.

#### blank

Withdthisiroption อตุลbled xsim will not define the default environments exercise and รด์ปีในปีเอากา

Those options are load-time options and are used the usual way as package options:

1 \usepackage[verbose]{xsim}

Although those options technically belong to the package module (see also section ??) it is *not* possible to set them via \xsimsetup.

#### 3.3 Setting Options

Apart from the package options already described in section **?? xsim** has further options. All those options are set using the following command:

```
\xsimsetup{\langle options \rangle}
```

Set up XSIM's package options and all other options described at other places in the manual.

Options can be "toplevel" options or options belonging to a module:

```
toplevel = \{\langle value \rangle\}
```

A toplevel option.

sublevel =  $\{\langle value \rangle\}$  A sublevel option bedønging to the module module

Both kinds of options are set with the setup command:

```
1 \xsimsetup{
2 toplevel = {value} ,
3 module/sublevel = {value}
4 }
```

### 3.4 Command descriptions

Some commands do have a \* symbol printed next to their names. This indicates that the command is expandable, *i. e.*, it is usable in an \edef or \write context and will expand according to its description. All other commands are engine protected, *i. e.*, in the sense of  $\epsilon$ -T<sub>F</sub>X's \protected.

Some command name descriptions end with TF.

```
\SomeCommandTF \langle arguments \rangle \{ \langle true \rangle \} \{ \langle false \rangle \}
```

A command with maybe some arguments and ending with the two arguments  $\langle true \rangle$  and  $\langle false \rangle$ .

This means two things: the command is a conditional which tests something and depending on the outcome of the test leaves either the  $\langle true \rangle$  argument (T) or the  $\langle false \rangle$  argument (F) in the input stream. It also means two additional commands exist:

```
\SomeCommandT\langle arguments\rangle \{\langle true\rangle\}
```

The same as  $\SomeCommandTF$  but only with the  $\langle true \rangle$  argument and no  $\langle false \rangle$  argument.

```
\SomeCommandF\langle arguments \rangle \{\langle false \rangle\}
```

The same as \SomeCommandTF but only with the  $\langle false \rangle$  argument and no  $\langle true \rangle$  argument.

## 4 Exercises and Solutions

The two predefined environments for exercises and solutions are the following ones 1:

```
\begin{exercise}[\langle properties \rangle]
```

Input and typeset an exercise. See section ?? for details on exercise properties.

```
\begin{solution}[\langle options \rangle]
```

Input and typeset the solution to the exercise of the previous exercise environment. See section ?? for details on options of solutions.

```
1 \begin{exercise}
2 A first example for an exercise.
3 \end{exercise}
4 \begin{solution}
```

<sup>1.</sup> When you load **XSIM** with the blank those environments will *not* be defined!

```
A first example for a solution.

Send{solution}

Exercise 1

A first example for an exercise.
```

As can be seen in the example a solution is not printed with the default setup. This can be changed using the following option.

The option (belonging to the module solution) can either be set locally as option to the solution environment

```
1 \begin{solution}[print=true]
2 A first example for a solution.
3 \end{solution}
```

or with the setup command for all following solutions:

```
1 \xsimsetup{
2  solution/print = true
3 }
```

There is an completely analoguous option for the exercise environment:

More details on those two environments can be found in section ??.

# 5 How the Exercise Environments Work

Both the exercise and the solution environments write the contents of their bodies verbatim to external files following a certain naming structure:

•  $\langle jobname \rangle - \langle type \rangle - \langle id \rangle$  - exercise | solution - body.tex

The name starts with the name of the job (which is the name of the document itself) followed by type and id of the corresponding exercise and then followed by the environment type. For example both environments from the first example have been written to files named

xsim-manual-exercise-1-exercise-body.tex and

• xsim-manual-exercise-1-solution-body.tex, respectively.

These external files are input when the respective exercise or solution is printed. An advantage of using external files is that *verbatim material is allowed* inside the environments. Details on the  $\langle type \rangle$  of an exercise will be given in section ??. The  $\langle id \rangle$  of an exercise is a positive integer unique to each exercise environment regardless if the exercise is being printed or used at all.

Each of those files contains some information about itself and where and why it was generated <sup>2</sup>:

```
% file `xsim-manual-exercise-l-exercise-body.tex'
% in folder `exercises/'
%
5 % exercise of type `exercise' with id `l'
6 %
7 % generated by the `exercise' environment of the
8 % `xsim' package v0.20 (2021/01/01)
9 % from source `xsim-manual' on 2021/01/24 on line 1
10 %

11 A first example for an exercise.
```

Arguably one downside of the approach using external files for each exercise and its solution is that your project folder will be cluttered with files. In order to deal with this somehow **XSIM** offers the following option:

```
path = {\langle path \ name \rangle}  (initially empty)
```

With this option a subfolder or path within the main project folder can be given. Exercises will be written to and included from this path. *The path must exist on your system before you can use it!* This document uses path = {exercises}.

```
file-extension = {\langle string \rangle} Default: tex
```

This option let's you choose the extension of the external files.

(Sep 19, 2017)

Another thing to keep in mind: the environment in many ways works the same way as the filecontents environment. This also means that you cannot have comments or \labels or anything else on the first line of the environments!

```
1 \begin{exercise}[points=2] % this comment will cause trouble
2 Lorem ipsum
3 \end{exercise}
```

<sup>2.</sup> In this example the sourcecode line number is misleading as the example where the file was generated itself was an external file where the exercise environment indeed was on line 1.

If you don't like allothe external files and the problems which come with them and if you don't red'any verbatim or similar material inside the exercises and solutions then you can use the following package option:

#### no-files

This package option prevents **XSIM** from writing the exercises and solutions to external files. This will keep your working folder "clean" but will also prevent using verbatim material in exercises and solutions and will possibly slow processing further down. *This option is considered experimental. Feedback is very welcome.* 

**xsim** writes a lot of stuff to an auxiliary file called \jobname.xsim (or the common \jobname.aux if you use option use-aux) for re-using information on subsequent compilations. If you add exercises, change properties *etc.* it might happen that wrong information is staying in the auxiliary file and is wrongly used by **xsim**. In such cases deleting the auxiliary file and doing a few fresh compilations may resolve your problems.

Sometimes the *existence of exercise or solution files from earlier compilations* may lead to wrong lists of exercises or solutions. In such cases it can be useful to delete all those files and doing a fresh compilation. It may be helpful to use a subfolder for those exernal files which will make deleting them a little bit easier. (Don't forget to both create the subfolder and set path accordingly then.)

Using the clear-aux option might help to reduce erroneous exercises.

A lot of the lines **XSIM** writes to the auxiliary file and reads in a subsequent run look like this:

```
1 \XSIM{points}{exercise-2=={4}||exercise-10=={2.5}||problem-11=={5}}
```

As you can see different entries of the various properties of exercises are separated with ||. This means that you cannot use this symbol combination inside properties. For this reason **XSIM** provides an option to change the marker.

```
split-aux-lists = \{\langle string \rangle\}
```

Default: ||

Set the string that is used to separate the property entries in the auxiliary file.  $(Feb\ 12,\ 2018)$ 

# 6 New Exercise Types

It is easy to define new exercise environments together with a corresponding solution environment using the following command:

```
\DeclareExerciseType{\langle type \rangle} {\langle parameters \rangle}
```

Declare a new exercise type analoguous to the exercise and solution environments.

Declaring a new exercise type will also define a new command:

```
\numberof\(\langle\) exercise-env\\s
```

These commands hold the absolut number of used exercises of type  $\langle type \rangle$ . The meaning of  $\langle exercise-env \rangle$  will become clear below when the exercise parameters are explained. It is always the same as the exercise environment name.

```
1 There are \numberofexercises~exercises and \numberofproblems~problem in this
2 manual.

There are o exercises and o problem in this manual.
```

XSIM's pre-defined environment pair has been defined as follows:

The above already is an example for almost all parameters that can (and often must) be set. Here is the complete list:

```
exercise-env = {\langle exercise \ environment \ name \rangle}
```

The name for the environment used for the exercises of type  $\langle type \rangle$ . This parameter is mandatory. It can't be changed afterwards.

```
solution-env = {\langle solution environment name\rangle}
```

The name for the environment used for the solutions of type  $\langle type \rangle$ . This parameter is mandatory. It can't be changed afterwards.

```
exercise-name = \{\langle exercise \ name \rangle\}
```

The name of the exercises of type  $\langle type \rangle$  – used for typesetting. This parameter is mandatory.

```
exercises-name = \{\langle exercises \ name \rangle\}
```

The plural name of the exercises of type  $\langle type \rangle$  – used for typesetting. If this is not set explicitly an s is appended to the singular name.

```
solution-name = \{\langle solution \ name \rangle\}
```

The name of the solutions of type  $\langle type \rangle$  – used for typesetting. This parameter is mandatory.

```
solutions-name = \{\langle solutions \ name \rangle\}
```

The plural name of the solutions of type  $\langle type \rangle$  – used for typesetting. If this is not set explicitly an s is appended to the singular name.

```
exercise-template = \{\langle exercise \ template \rangle\}
```

The template used for typesetting the exercises of type  $\langle type \rangle$ . This parameter is mandatory. See section ?? for details on templates.

```
solution-template = {\langle solution \ template \rangle}
```

The template used for typesetting the exercises of type  $\langle type \rangle$ . This parameter is mandatory. See section ?? for details on templates.

```
counter = \{\langle counter \ name \rangle\}
```

The counter used for the exercises of type  $\langle type \rangle$ . If not explicitly set the counter with the same name as exercise-env is used. Otherwise the specified counter is used. This enables to have different types of exercises sharing a common counter. *This parameter can't be changed afterwards*. If the explicit or implicit counter does not exist, yet, it will be defined.

```
solution-counter = \{\langle counter \ name \rangle\}
```

The counter used for the solutions of type  $\langle type \rangle$ . If not explicitly set the counter with the same name as **solution-env** is used. Otherwise the specified counter is used. This enables to have different types of solutions sharing a common counter although this doesn't actually make much sense. But it can be useful to avoid using an already existing counter. *This parameter can't be changed afterwards*. If the explicit or implicit counter does not exist, yet, it will be defined. The sole purpose of this counter is to be able to label solutions so they can be \pagerefed.

```
number = \{\langle integer \rangle\}
```

An internal parameter that is used to keep track of the number of exercises of a type. This parameter cannot be set or changed by the user.

```
exercise-heading = {\langle exercise heading command\rand\rangle}
```

The command used for typesetting of the heading of exercises of type  $\langle type \rangle$  – used for typesetting with the command \GetExerciseHeadingF.

```
solution-heading = {\langle solution heading command \rangle}
```

The command used for typesetting of the heading of solutions of type  $\langle type \rangle$  – used for typesetting with the command \GetExerciseHeadingF.

It is possible to change some of the parameters after an exercise type has been defined. Those include exercise-name, solution-name, exercise-template, and solution-template. It is also possible to define new parameters.

```
\DeclareExerciseParameter*{\langle parameter \rangle}
```

Declares the new parameter \( \rangle parameter \rangle \). The optional star declares a fixed parameter which

#### 7 Exercise Properties

cannot be changed once it is set. You probably will never need this command. Most tasks can be solved using properties (see section ??) instead.

```
\SetExerciseParameter{\langle type \rangle} {\langle parameter \rangle} {\langle value \rangle}
```

Usable to set a single parameter to a new value.

```
\SetExerciseParameters{\langle type \rangle} {\langle parameters \rangle}
```

Set several parameters at once. (parameters) is a csv list of key/value pairs.

If you try to set an already set but fixed parameter like exercise-env a warning will be written to the log file. For all parameters that can be changed also options exist wich can be set via \xsimsetup. They are explained in section ??.

All exercises of a type use the parameters (e.g., exercise-template) that are *currently active*. If you want exercises with a different look or different names in the same document you should use different exercises types.

# **7** Exercise Properties

## 7.1 Predefined Properties

Exercise like the exercise environment and possibly others defined with \DeclareExerciseType have a number of predefined properties:

```
id = {\langle integer \rangle}
```

Holds the internal id of an exercise. *Cannot be set by the user*.

```
ID = \{\langle text \rangle\}
```

Holds the user id of an exercise if defined. Otherwise it is equal to id.

```
counter = \{\langle text \rangle\}
```

Holds the counter value representation of an exercise (*i. e.*, what you usually know as  $\text{the}\langle counter \rangle$ ). *Cannot be set by the user.* 

```
counter-value = \{\langle integer \rangle\}
```

Holds the counter value of an exercise (*i. e.*, what you usually know as  $\text{the}\$ ). Cannot be set by the user.

```
subtitle = \{\langle text \rangle\}
```

Holds the subtitle of an exercise.

```
points = \{\langle number \rangle\}
```

Holds the reachable points of an exercise.

```
bonus-points = \{\langle number \rangle\}
```

Holds the reachable bonus-points of an exercise.

```
print = true|false
  Holds the print boolean of an exercise.
print! = true|false
  Holds a special print boolean of an exercise, see page ??.
use = true|false
  Holds the usage boolean of an exercise.
use! = true|false
  Holds a special usage boolean of an exercise, see page ??.
used = true|false
  True if an exercise has been used at least once. For an existing exercise this is only false for
  exercises that have been collected (cf. section ??).
solution = true|false
  Holdsuthe solution boolean of an exercise. If this is true then a solution has the same text/
  efforment body as the corresponding exercise. (This might be useful for multiple choice
  questions for example.)
tags = \{\langle csv \ list \ of \ tags \rangle\}
  Holds the list of tags the exercise should be associated with.
topics = \{\langle csv | list | of topics \rangle\}
  Holds the list of topics the exercise should be associated with.
page = \{\langle text \rangle\}
  Holds the page counter value representation of an exercise
  (i. e., what you usually know as \thepage).
page-value = \{\langle integer \rangle\}
  Holds the page counter value of an exercise
  (i. e., what you usually know as \the\value{page}).
section = \{\langle text \rangle\}
  Holds the section counter value representation of an exercise
  (i. e., what you usually know as \thesection).
section-value = \{\langle integer \rangle\}
  Holds the section counter value of an exercise
  (i. e., what you usually know as \the\value{section}).
chapter = \{\langle text \rangle\}
  Holds the chapter counter value representation of an exercise
  (i. e., what you usually know as \thechapter).
  Only if a command \ chapter and a counter chapter exist.
```

```
chapter-value = \{\langle integer \rangle\}
```

Holds the chapter counter value of an exercise

(i. e., what you usually know as \the\value{chapter}).

Only if a command \ chapter and a counter chapter exist.

```
sectioning = \{\langle section \ numbers \rangle\}
```

Holds five brace groups which in turn hold the section numbers (integers) of the exercise in the order  $\{\langle chapter \rangle\}\{\langle subsection \rangle\}\{\langle subsection \rangle\}\{\langle subsection \rangle\}\}$ .

```
exercise-body = \{\langle T_E X code \rangle\}
```

When the package option 30-files is set this property is defined and holds the environment body of an exercise.

```
solution-body = \{\langle T_E X code \rangle\}
```

When the package option 30-files is set this property is defined and holds the environment body of the corresponding solution.

Some of these properties are fixed and cannot be set by the user. Those include id, counter, and counter-value. The others can be set using the optional argument of the exercise environment.

```
\begin{exercise}[subtitle={This is a subtitle}, points=4, bonus-points=1]
```

- <sup>2</sup> An exercise where some properties have been set.
- 3 \end{exercise}

**Exercise 2** This is a subtitle

An exercise where some properties have been set.

## 7.2 Declaring Own Properties

**XSIM** offers the possibility to declare additional exercise properties:

```
\DeclareExerciseProperty!*-{\langle property\rangle}
```

Declares the property  $\langle property \rangle$ .

If used with the optional! a **unique property** is defined which means that each exercise must have a property value distinct from all other exercises (all means all – *independent from the exercise type*).

If used with the optional \* a **boolean property** is defined which means that it only should get the values true or false and if used without value it gets the value true instead of an empty value. If any other value is used the property is set to false. A boolean property obviously cannot be unique. The optional \* takes precedence over the optional !, *i. e.*, if both are present the property is boolean *but not* unique.

If used with the optional - a property is defined which won't get updated through subsequent compilation runs but is only set when the exercise is used.

```
\DeclareExercisePropertyAlias\{\langle property 1 \rangle\}\{\langle property 2 \rangle\}
```

Declares  $\langle property \ 1 \rangle$  to be an alias of  $\langle property \ 2 \rangle$ . This means that each time  $\langle property \ 2 \rangle$  is set  $\langle property \ 1 \rangle$  will be set to the same value *unless* it has been set already. As an example: property ID is an alias of property id.

This is better demonstrated with an example:

```
1 \begin{exercise}
  \verb+\GetExerciseProperty{id}+: \GetExerciseProperty{id} \par
   \verb+\GetExerciseAliasProperty{ID}+: \GetExerciseAliasProperty{ID} \par
   \verb+\GetExerciseProperty{ID}+: \GetExerciseProperty{ID}
5 \end{exercise}
6 \begin{exercise}[ID=foo-bar]
   \verb+\GetExerciseProperty{id}+: \GetExerciseProperty{id} \par
   \verb+\GetExerciseAliasProperty{ID}+: \GetExerciseAliasProperty{ID} \par
   \verb+\GetExerciseProperty{ID}+: \GetExerciseProperty{ID}
10 \end{exercise}
Exercise 3
\GetExerciseProperty{id}: 3
\GetExerciseAliasProperty{ID}: 3
\GetExerciseProperty{ID}: 3
Exercise 4
\GetExerciseProperty{id}: 4
\GetExerciseAliasProperty{ID}: 4
\GetExerciseProperty{ID}: foo-bar
```

The power of properties will get more clear when reading section ?? about templates.

## 7.3 A Special Kind of Property: Exercise Goals

Exercise goals are a generic concept in XSIM for exercise properties like points or bonus-points. Those are properties which can (only) get a decimal number as value the sum of which is calculated and available (after a compilation) throughout the document.

```
\DeclareExerciseGoal{\langle goal \rangle}
```

Declare a new exercise goal named  $\langle goal \rangle$  and also a property called  $\langle goal \rangle$ .

```
\TotalExerciseTypeGoal\{\langle type \rangle\}\{\langle goal \rangle\}\{\langle singular \rangle\}\{\langle plural \rangle\}
```

Get the sum of goal  $\langle goal \rangle$  for all exercises of type  $\langle type \rangle$ .  $\langle singular \rangle$  and  $\langle plural \rangle$  are placed after the sum in the input stream depending on whether the sum equals 1 or not.

```
\TotalExerciseTypeGoals{\langle type \rangle}{\langle list\ of\ goals \rangle}{\langle singular \rangle}{\langle plural \rangle}
```

Get the sum of goal all goals in  $\langle list\ of\ goals \rangle$  for all exercises of type  $\langle type \rangle$ . The goal names

#### 7 Exercise Properties

in  $\langle list\ of\ goals \rangle$  must be separated with +.  $\langle singular \rangle$  and  $\langle plural \rangle$  are placed after the sum in the input stream depending on whether the sum equals 1 or not.

#### $\TotalExerciseGoal\{\langle goal\rangle\}\{\langle singular\rangle\}\{\langle plural\rangle\}$

Get the sum of goal  $\langle goal \rangle$  for all exercises.  $\langle singular \rangle$  and  $\langle plural \rangle$  are placed after the sum in the input stream depending on whether the sum equals 1 or not.

# $\verb|\TotalExerciseGoals|{| list of goals|}{| singular|}{| continued | continue$

Get the sum of goal all goals in  $\langle list\ of\ goals \rangle$  for all exercises. The goal names in  $\langle list\ of\ goals \rangle$  must be separated with +.  $\langle singular \rangle$  and  $\langle plural \rangle$  are placed after the sum in the input stream depending on whether the sum equals 1 or not.

# $\AddtoExerciseTypeGoal\{\langle type\rangle\}\{\langle goal\rangle\}\{\langle value\rangle\}\}$

Adds  $\langle value \rangle$  to the goal  $\langle goal \rangle$  of exercise type  $\langle type \rangle$ .

## $\label{lem:addtoExerciseTypeGoalPrint} $$ \AddtoExerciseTypeGoalPrint{$\langle type \rangle$} {\langle goal \rangle} {\langle value \rangle} {\langle singular \rangle} {\langle plural \rangle} $$$

Adds  $\langle value \rangle$  to the goal  $\langle goal \rangle$  of exercise type  $\langle type \rangle$ . The value and – depending on wether the value equals 1 or not –  $\langle singular \rangle$  or  $\langle plural \rangle$  are left in the input stream.

# $\AddtoExerciseGoal\{\langle goal\rangle\}\{\langle value\rangle\}$

Adds  $\langle value \rangle$  to the goal  $\langle goal \rangle$  of the current exercise type. (To be used within exercises.)

## 

Adds  $\langle value \rangle$  to the goal  $\langle goal \rangle$  of the current exercise type. The value and – depending on wether the value equals 1 or not –  $\langle singular \rangle$  or  $\langle plural \rangle$  are left in the input stream. (To be used within exercises.)

## $\ExerciseGoalValuePrint{\langle value \rangle} {\langle singular \rangle} {\langle plural \rangle}$

Print  $\langle value \rangle$  and – depending on wether the value equals 1 or not –  $\langle singular \rangle$  or  $\langle plural \rangle$ .

#### \printgoal{\langle value \rangle}

Print (value) according to option goal-print. Defined in terms of \ExerciseGoalValuePrint.

### $\printpoints{\langle type \rangle}$

Print the sum of points for all exercises of type  $\langle type \rangle$  followed by an appropriate translation of the words "point" or "points", respectively.<sup>3</sup> Defined in terms of \TotalExerciseTypeGoal.

## **\printtotalpoints**

Print the sum of points for all exercises followed by an appropriate translation of the words "point" or "points", respectively. Defined in terms of \TotalExerciseGoal.

#### $\addpoints*{\langle value \rangle}$

Adds (value) to the points of the current exercise type. (To be used within exercises.) Prints the value followed by an appropriate translation of the words "point" or "points", respectively. The starred version prints nothing. Defined in terms of \AddtoExerciseGoal and \AddtoExerciseGoalPrint.

<sup>3.</sup> See section ?? for details on the definition and usage of language dependent words.

#### 7 Exercise Properties

#### \points{\langle value \rangle}

Print \(\nabla value \rangle \) followed by an appropriate translation of the words "point" or "points", respectively. Defined in terms of \(\text{ExerciseGoalValuePrint}\).

```
\printbonus{\langle type \rangle}
```

Print the sum of bonus points for all exercises of type  $\langle type \rangle$  followed by an appropriate translation of the words "point" or "points", respectively. Defined in terms of \TotalExerciseTypeGoal.

#### \printtotalbonus

Print the sum of bonus points for all exercises followed by an appropriate translation of the words "point" or "points", respectively. Defined in terms of \TotalExerciseGoal.

```
\addbonus*{\langle value \rangle}
```

Adds (*value*) to the bonus points of the current exercise type. (To be used within exercises.) Prints the value followed by an appropriate translation of the words "point" or "points", respectively. The starred version prints nothing. Defined in terms of \AddtoExerciseGoal and \AddtoExerciseGoalPrint.

The two existing goals are defined with

```
1 \DeclareExerciseGoal{points}
2 \DeclareExerciseGoal{bonus-points}
```

When goal values are printed the decimal number is fed to a function which can be changed using the following option:

```
goal-print = {\langle code \rangle} Default: #1
```

How to format goal values. Use #1 to refer to the actual number.

At last some examples for a custom command: let's say you want a command which prints the complete sum for all exercises of all exercise types of both points and bonus-points added up:

Here is how you could mimick the command \totalpoints from exsheets:

```
\NewDocumentCommand\pointsandbonus{}{%
\TotalExerciseGoal{points}{}{}%
\IfExerciseGoalsSumF{bonus-points}{=0}
```

```
{ \\,(+\,\TotalExerciseGoal{bonus-points}{}{})}%
  \\,\XSIMtranslate{points}%
  }
}
```

## 7.4 A Special Kind of Property: Exercise Tags

Exercise tags are a generic concept in XSIM for exercise properties like tags or topics. Those are properties which can (only) get a csv list of strings as value. Those strings can be used to selectively use exercises. See section ?? for details on *usage* of exercises and the difference to *printing* an exercise and how to use exercise tags for selection.

```
\DeclareExerciseTagging\{\langle tag \rangle\}
```

This defines an exercise tagging group named  $\langle tag \rangle$ . It also defines a property named  $\langle tag \rangle$ . In addition two options are defined: an option named  $\langle tag \rangle$  which can be used for selection and an boolean option  $\langle tag \rangle$ /ignore-untagged.

```
\ProvideExerciseTagging{\langle tag \rangle}
```

The same as differing Exercise Tagging but does nothing when \(\lambda tag\rangle\) already exists. (Feb 12, 2018)

The two existing tagging groups have been defined and preset with the following code:

```
    \DeclareExerciseTagging{tags}
    \DeclareExerciseTagging{topics}
    \xsimsetup{tags/ignore-untagged=false}
```

This means that these options are available:

```
tags = \{\langle csv \ list \ of \ tags \rangle\}
```

Choose the set of tags whose associated exercises should be printed.

```
topics = \{\langle csv \ list \ of \ topics \rangle\}
```

Choose the set of topics whose associated exercises should be printed.

If set to true exercises with no tags will be printed even if tags have been chosen with the option tags.

Default: false

If set to true exercises with no topics will be printed even if topics have been chosen with the option topics.

It may happen that you choose certain tags for printing and want one or two exercises to be printed or used even if they don't match the tagging criteria. For this reason two additional properties exist which can be set to an exercise:

#### print! = true|false

If set to true the exercise will be printed (and thus used) regardless of other conditions.

```
use! = true|false
```

If set to true the exercise will be used regardless of other conditions.

# 8 Using and Printing an Exercise

#### 8.1 What the Environments do

When an exercise is started with \begin{exercise} (or other environments defined through \DeclareExerciseType) then different things happen depending on different settings:

- If the *insert mode* is active nothing happens, see section ?? for details on this.
- Else the id integer is incremented.
- If the exercise is *used* the corresponding counter is stepped and the exercise is added to the "use list". The properties counter and use are updated accordingly.
- If an exercise is *printed* then it is also *used*. An exercise that isn't used cannot be printed. Being printed means two things: being added to the "print list" and being typeset at the position where the exercise is placed in the source file. If an exercise is *not printed but used* it means that the counter will be stepped. This can be useful for creating an exercise sheet only containing the solutions for some exercises.
- If an exercise is printed certain hooks and template code is inserted around the environment body.

```
begin{exercise}[print=false,ID=invisible]
```

- <sup>2</sup> This exercise will not be printed but the exercise counter will be
- incremented nonetheless. Its solution will be printed in the list of
- solutions.
- 5 \end{exercise}
- 6 \begin{solution}
- The solution of the exercise that has not been printed.
- 8 \end{solution}

#### Exercise 5

This exercise will not be printed but the exercise counter will be incremented nonetheless. Its solution will be printed in the list of solutions.

The schematic structure of an exercise is shown in figure ??.

#### 8 Using and Printing an Exercise

pre hook
begin template code
begin hook
environment body
end hook
end template code
post hook

FIGURE 1: Schematic structure of an exercise or solution.

# 8.2 Environment Options & Hooks

For each exercise type there are the following options for both environments, the environments' names are the module names for the options (here using the "exercise" type):

```
print = true|false
                                    exercise/
                                                                                        Default: true
  Determines if exercises of type "exercise" are printed.
                                                                                        Default: true
use = true|false
                                 exercise/
  Determines if exercises of type "exercise" are used.
within = \{\langle counter \rangle\}
                                     exercise/
                                                                                     (initially empty)
  Adds the exercise counter to the reset list of the counter (counter) using \counterwithin.
  Beware that if the counter is a shared counter this will affect all objects using this counter!
the-counter = \{\langle code \rangle\}
                                        exercise/
  An interface for redefining the counter representation command \the\(\chi\)counter\.
template = \{\langle template \rangle\}
                                         exercise/
  An interface for \SetExerciseParameter{exercise}{exercise-template}{\langle template \rangle}.
template = \{\langle template \rangle\}
                                         solution/
  An interface for \SetExerciseParameter{exercise}{solution-template}{(template)}.
name = \{\langle name \rangle\}
                                exercise/
  An interface for \SetExerciseParameter{exercise}{exercise-name}{\langle name \rangle}.
name = \{\langle name \rangle\}
                                solution/
  An interface for \SetExerciseParameter{exercise}{solution-name}{\langle name \rangle}.
```

```
heading = \{\langle heading \ command \rangle\}
                                                      exercise/
  An interface for A Sot Exercise Parameter {exercise} {exercise-heading} {\langle heading\ command \rangle}.
       (Oct 13, 2019)
heading = \{\langle heading \ command \rangle\}
                                                      solution/
  An interface for A Sot Exercise Parameter {exercise} {solution-heading} {(heading\ command)}.
       (Oct 13, 2019)
                                                                                            (initially empty)
pre-hook = \{\langle code \rangle\}
                                       exercise/
  The code for the pre exercise hook for exercises of the type "exercise".
begin-hook = \{\langle code \rangle\}
                                          exercise/
                                                                                            (initially empty)
  The code for the begin exercise hook for exercises of the type "exercise".
end-hook = \{\langle code \rangle\}
                                       exercise/
                                                                                            (initially empty)
  The code for the end exercise hook for exercises of the type "exercise".
post-hook = \{\langle code \rangle\}
                                        exercise/
                                                                                            (initially empty)
  The code for the post exercise hook for exercises of the type "exercise".
                                                                                              Default: false
print = true|false
                                       solution/
  Determines if solutions of type "exercise" are printed.
pre-hook = \{\langle code \rangle\}
                                       solution/
                                                                                            (initially empty)
  The code for the pre solution hook for solutions of the type "exercise".
begin-hook = \{\langle code \rangle\}
                                          solution/
                                                                                            (initially empty)
  The code for the begin solution hook for solutions of the type "exercise".
                                                                                            (initially empty)
end-hook = \{\langle code \rangle\}
                                       solution/
  The code for the end solution hook for solutions of the type "exercise".
post-hook = \{\langle code \rangle\}
                                        solution/
                                                                                            (initially empty)
  The code for the post solution hook for solutions of the type "exercise".
   8.3 (Re-) Inserting a Certain Exercise
  If you know type and id of an exercise you can (re-)insert every existing exercise, i. e., every
   exercise whose external file exists.
\printexercise{\langle type \rangle} {\langle csv \ of \ ids \rangle}
  Inserts the exercise or exercises of type \langle type \rangle with the ids or IDs given in \langle csv \ of \ ids \rangle.
    (Feb 21, 2020)
\xspace xprintexercise {\langle type \rangle} {\langle csv \ of \ ids \rangle}
   The same is exposint exercise but expands \langle type \rangle and the items of \langle csv \ of \ ids \rangle before it uses
   themged with version 0.17
       1 \printexercise{exercise}{invisible}
```

#### Exercise 5

This exercise will not be printed but the exercise counter will be incremented nonetheless. Its solution will be printed in the list of solutions.

# 9 Collecting Exercises

The whole collection mechanism is likely to change completely in the not-so-far future (let's say sometime in the six months from April 2020 or so).

# 9.1 Background

**XSIM** knows the concept of "exercise collections". A collection of exercises can be useful when you want to print a certain group of exercises several times. Each collection must have a unique name with which you can refer to the corresponding collection. A collection is realized by declaring the collection and by surrounding the exercises belonging to the collection with a certain pair of commands (this is explained in the next section).

Let's say you have several files of math exercises where one only contains geometry exercises and another only calculus exercises and so on. Surrounding the \input of each file with said pair of commands for a certain collection all exercises of the corresponding file now are a collection which then can be printed at once whereever you want the collection of exercises to be printed. By choosing certain tags (see section ??) inside each collection you could even cherry-pick exercises from the external file.

## 9.2 Usage

A collection must be declared in the preamble. Using a pair of commands explained below exercises between those commands are added to the corresponding collection but not printed. After a collection is completed the collection can be printed as often as needed.

#### \DeclareExerciseCollection{\langle collection name\rangle}

Define a new collection *(collection name)* in the document preamble.

## $\collectexercisestype{\langle collection\ name \rangle}{\langle exercise\ type \rangle}$

Opens the collection  $\langle collection \ name \rangle$  which now collects all exercises of type  $\langle exercise \ type \rangle$  until the collection is closed with  $\langle collectexercisesstop \rangle$ . Collections of other types are not collected.<sup>4</sup>

## $\collectexercises{\langle collection name \rangle}$

Opens the collection \( \langle collection name \rangle \) which now collects all exercises until the collection is closed with \( \collectexercisesstop. \) 5

- 4. This command starts a group with \begingroup!
- 5. This command starts a group with \begingroup!

```
\collectexercisesstop\{\langle collection\ name \rangle\}\ Closes the collection \langle collection\ name \rangle.
```

```
\printcollection[\langle options \rangle] \{ \langle collection name \rangle \}
```

Prints the collection  $\langle collection \ name \rangle$ , *i. e.*, all exercises collected earlier. This command cannot be used before the corresponding collection has been closed correctly.

```
Valid options are the following:

headings = true|false print-collection/ Default: false
If true a heading for each exercise type is inserted.

headings-template = {\langle template \rangle} print-collection/ Default: collection
The heading template used when headings = {true}.

print = exercises|solutions|both print-collection/ Default: exercises
Determines wether \printcollection prints the exercises or the solutions of the collection.
When you choose both exercises and solutions are printed alternately.
```

Those options can also be set via \xsimsetup using the module print-collection.

Please be aware that exercises are not used or printed while they are collected. Nonetheless the property use is set to true (so that solutions can be printed even if the exercises are not) and the property print is set to false. Also their counters are not stepped during the process. This only happens when they are printed the first time, cf. the used property. At that time also the properties page, section and chapter are set and the property print is set to true.

The usage should be clear:

```
1 \collectexercises{foo}
2 \begin{exercise}
3 This exercise is added to the collection `foo'.
4 \end{exercise}
5 \begin{exercise}
6 This exercise is also added to the collection `foo'.
7 \end{exercise}
8 \begin{exercise}
9 So is this.
10 \end{exercise}
11 \begin{exercise}
12 As well as this one.
13 \end{exercise}
14 \collectexercisesstop{foo}
```

<sup>6.</sup> This command ends a group with \endgroup!

Once the collection is closed it can be printed:

1 \printcollection{foo}

#### Exercise 1

A first example for an exercise.

#### **Exercise 2** This is a subtitle

An exercise where some properties have been set.

# Exercise 3

```
\GetExerciseProperty{id}: 3
\GetExerciseAliasProperty{ID}: 3
\GetExerciseProperty{ID}: 3
```

# Exercise 4

```
\GetExerciseProperty{id}: 4
\GetExerciseAliasProperty{ID}: 4
\GetExerciseProperty{ID}: foo-bar
```

## Exercise 5

This exercise will not be printed but the exercise counter will be incremented nonetheless. Its solution will be printed in the list of solutions.

### **Exercise**

This exercise is added to the collection 'foo'.

#### **Exercise**

This exercise is also added to the collection 'foo'.

#### **Exercise**

So is this.

#### **Exercise**

As well as this one.

You can open several collections at the same time:

```
1 \collectexercises{foo}
2 ...
3 \collectexercisestype{bar}{exercises}
4 ...
5 \collectexercisesstop{bar}
6 ...
7 \collectexercisesstop{foo}
```

Exercises will be added to each open collection.

There is one generic collection called "all exercises". As the name already suggests it will hold all exercises. So if you say

```
    \printcollection{all exercises}
```

all exercises will be printed.

If you use **\labels** inside of exercises and you print exercises more than once in your document (by reusing a collection for example) you will get

```
LaTeX Warning: There were multiply-defined labels.
```

Equally if you have environments like \begin{equation} which step a counter inside an exercise or solution the counter will be stepped each time the exercise is used.

At last now an example using external files, collections and tags:

```
1 % preamble:
2 % \DeclareExerciseCollection{foo-easy}
3 % \DeclareExerciseCollection{foo-medium}
4 % \DeclareExerciseTagging{difficulty}

5
6 % document:
7 \collectexercises{foo-easy}
8 \xsimsetup{difficulty=easy}
9 \input{foo.tex}
```

```
10 \collectexercisesstop{foo-easy}
11 % collection `foo-easy' now contains all exercises of file `foo.tex' tagged
12 % with `difficulty=easy'
13
14 \collectexercises{foo-medium}
15 \xsimsetup{difficulty=medium}
16 \input{foo.tex}
17 \collectexercisesstop{foo-medium}
18 % collection `foo-medium' now contains all exercises of file `foo.tex'
19 % tagged with `difficulty=medium'
```

The recommended usage is similar to the last example. Actually a collection can be printed *before* it is opened, too. (This needs *at least* two compilations, though.) However, it is safer printing a collection only once and only *after it has been collected*. No guaranties are given that properties are set correctly if you use the collection before. You usually also will make sure that the exercises in a collection are unique, *i. e.*, that an exercise is not part of several collections – at least not if both collections are printed in the same document.

# 10 Printing Random Exercises From a Collection

**XSIM** provides the possibility of selecting random exercises from a collection (*cf.* section ??).

Please be aware that this feature is *not* available in X<sub>3</sub>IFT<sub>E</sub>X!

```
\printrandomexercises[\langle options \rangle] \{\langle number \rangle\}
```

This command prints  $\langle number \rangle$  random exercises from the collection chosen with option collection, see below. When this command is used it generates a random list of integers which is written to the aux file. On the subsequent compilations the according exercises are printed. If you want to regenerate the random list you have to delete the aux file before compiling.

Valid options for this command are:

```
collection = {\langle collection \rangle}  random/ Default: all exercises
```

The collection from which the exercises are to be chosen from.

```
exclude = \{\langle csv \ list \ of \ ids \rangle\} random/
A list of ids or IDs of exercises not to be chosen.
```

print = exercises|solutions|both random/ Default: exercises
 Determines wether \printrandomexercises prints the exercises or the solutions. When you
 choose both exercises and solutions are printed alternately.

```
1 \printrandomexercises[collection=foo]{2}
```

The example above of course doesn't make much sense but if you have a collection which collects exercises from an external file and the exercises haven't been printed in the document before then you will get a list of subsequently numbered exercises.

# 11 Printing Solutions

There are different commands for printing the solutions to exercises:

```
\printsolutionstype*[\langle options \rangle] \{ \langle exercise type \rangle \}
```

Prints the solutions of all used exercises of type  $\langle exercise\ type \rangle$ . The starred version only prints the solutions of all printed exercises of type  $\langle exercise\ type \rangle$ .

```
\printsolutions*[\langle options \rangle]
```

Prints the solutions of all used exercises of all types ordered by type. The starred version only prints the solutions of all printed exercises of all types.

```
\printallsolutions*[\langle options \rangle]
```

Prints the solutions of all used exercises of all types ordered by appearance in the document. The starred version only prints the solutions of all printed exercises of all types.

```
\printsolution[\langle options \rangle] \{\langle type \rangle\} \{\langle id \rangle\}
```

Prints the solution of the exercise of type  $\langle type \rangle$  with the id  $\langle id \rangle$ .

```
\xspace \xsp
```

The same as  $\langle rgoints olution$  but expands  $\langle type \rangle$  and  $\langle id \rangle$  before it uses them.

```
(Nov 10, 2019)
```

```
ı \printsolutionstype{exercise}
```

The options can be divided into two groups. The ones in the first group modify the layout.

```
headings = true|false print-solutions/ Default: true
If true a heading for each exercise type is inserted.
```

```
headings-template = \{\langle template \rangle\} print-solutions/ Default: default The heading template used when headings = \{true\}.
```

#### 11 Printing Solutions

The ones in the second group set conditions selecting which solutions are printed. If you combine those conditions a solution is printed if it meets either of the conditions.

```
section = true|false|(integer) print-solutions/ Default: false
If you set section = {true} only solutions of exercises of the current section are printed. If
you set section = {4} only solutions of exercises in a section with number 4 are printed.
```

```
chapter = true | false | (integer) print-solutions/ Default: false
  If you set chapter = {true} only solutions of exercises of the current chapter are printed. If
  you set chapter = {4} only solutions of exercises in a chapter with number 4 are printed.
```

```
collection = false|⟨collection name⟩ print-solutions/ Default: false
  If used only solutions of exercises belonging to collection ⟨collection name⟩ are printed.
```

The conditions can be combined. The following call will only print solutions from exercises in section 3 of chapter 2:

```
1 \printsolutions[chapter=2,section=3]
```

The selection per section or per chapter relies on the *counter numbers* of the sections or chapters, respectively. This means if section numbers are reset (*e. g.* by \chapter or \appendix) and you have exercises from *different* sections with *the same section number* the solutions of *all those exercises* will be printed. This means you only should use the section selection when section are the top document level headings (apart from parts) and you have no exercises in the appendix. Similar considerations are valid for the chapter selection.

All options can also be set via \xsimsetup using the module print-solutions.

```
1 \printsolutions[section=4,headings-template=per-section]
```

1 \printsolution{exercise}{5}

#### Solution 5

The solution of the exercise that has not been printed.

# 12 Grading Tables

When you create exercises it may not only be desirable to be able to add points and bonuspoints to a question (see section ?? about exercise goals) but also to be able to output a grading table. **XSIM** has built-in means for this.

```
\gradingtable[\langle options \rangle]
```

Print a grading table.

Valid options for this command are

```
template = \{\langle template \rangle\}
```

Default: default

Choose the template used for the grading table.

```
type = \{\langle exercise \ type \rangle\}
```

(initially empty)

Choose the exercise type for which the table is printed.

Both option defaults can be changed with \xsimsetup setting the options using grading-table:

```
1 \xsimsetup{
2  grading-table/template = default*
3 }
```

An example:

```
1 \gradingtable[type=exercise]
```

Exercise	Points	reached
1	0	
2	4	
3	0	
4	0	
5	0	
total	0	

Or using the "default\*" template:

```
1 \gradingtable[template=default*, type=exercise]
```

Available templates and how to define new ones are explained in sections ?? and ??. xsim per default provides two templates "default" and "default\*", the first one has a vertical layout,

the second a horizontal layout. Both templates can be used per type like in the examples above or for all types at once by leaving the specification type away:

ı \gradingtable		
	Points	reached
Exercise 1	0	
Exercise 2	4	
Exercise 3	0	
Exercise 4	0	
Exercise 5	0	
total	0	

# 13 Styling the Exercises - Templates

# 13.1 Background

Whenever **XSIM** outputs something to be typeset it uses so-called templates for the task. **XSIM** knows of three different kinds of templates:

- environment templates (see section ??),
- heading templates (see section ??) and
- grading table templates (see section ??)

The most important one for the styling of the exercises are the environment templates. Those templates give you complete control over the look and arrangement of an exercise. To be able to do this **xsim** provides a large number of commands which can be used only inside template definitions. Those commands are explained in the next section. Their usage will hopefully become clear in the examples in section ??. Having full control over the layout comes at a price: you need to be able to program yourself in order to achieve certain layouts.

## 13.2 Templates Provided by the Package

**XSIM** comes with a few predefined layouts:

**default** The template activated per default and the only one available without further action.

<sup>7.</sup> The last sentence is wrong: those commands can be used anywhere but most of them only give useful results inside of templates.

<sup>8.</sup> I plan to incorporate the most common layouts – and maybe some fancy ones, too – in the examples section ?? but at the time of writing this is still up in the air.

- **runin** A layout rather similar to the one by package exsheets, see section ??. Available through the style file layouts (see section ?? for more information on style files).
- **margin** A layout rather similar to the one by package exsheets, see section ??. Available through the style file layouts.
- minimal A minimalistic layout<sub>3</sub> see section ??. As the others inspired by an exsheets layout. Available through the style file layouts.
- inline A minimalistic layout, the same as minimal but doesn't add \par at the beginning and efitt. 'A ধর্মা labe through the style file layouts.
- **centered** A layoutcwith a contered heading. Available through the style file layouts. (Feb 23, 2020)

## Layout "default"

#### Exercise 6 The Subtitle

Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

#### Layout "margin"

Exercise 6 Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, (2.5 p.) placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

#### Layout "inline"

**6** (2.5 points) Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

### Layout "minimal" (Like "inline" but as own paragraph.)

**6** (2.5 points) Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

# Layout "centered"

#### Exercise 6 The Subtitle

Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

## 13.3 Commands for Usage in Template Definitions

13.3.1 Goals

\IfExerciseGoal\IF{\langle goal\rangle} \{\rangle relation and value\rangle} \{\langle true\rangle} \{\langle false\rangle}\}

Checks the sum of goal \langle goal\rangle against \langle relation and value\rangle.

 $\IfExerciseGoalSingular IF {\langle goal \rangle} {\langle true \rangle} {\langle false \rangle}$ 

Checks if the value of the goal  $\langle goal \rangle$  of the current exercise equals 1. This is the same as  $\mathbf{f}_{\langle goal \rangle} = 1$  ( $\langle true \rangle$ ) { $\langle false \rangle$ }.

\IfExerciseTypeGoalsSumTF\{\langle type\}\{\langle list of goals\}\{\langle relation and value\}\{\langle true\}\{\langle false\}\}\
Ckecks the sum of all goals in \langle list of goals\rangle for the exercises of type \langle type\rangle against \langle relation and value\rangle.

\IfExerciseGoalsSumTF{ $\langle type \rangle$ }{ $\langle list\ of\ goals \rangle$ }{ $\langle relation\ and\ value \rangle$ }{ $\langle true \rangle$ }{ $\langle false \rangle$ } Ckecks the sum of all goals in  $\langle list\ of\ goals \rangle$  for all exercises of all types against  $\langle relation\ and\ value \rangle$ .

```
\TotalExerciseTypeGoal\{\langle goal\rangle\}\{\langle type\rangle\}\{\langle singular\rangle\}\{\langle plural\rangle\}
```

Print the sum of goal  $\langle goal \rangle$  for the exercises of type  $\langle type \rangle$  and append  $\langle singular \rangle$  or  $\langle plural \rangle$  depending on wether the sum equals 1 or not.

```
\TotalExerciseGoal\{\langle goal\rangle\}\{\langle singular\rangle\}\{\langle plural\rangle\}
```

Print the sum of goal  $\langle goal \rangle$  for all exercises of all types and append  $\langle singular \rangle$  or  $\langle plural \rangle$  depending on wether the sum equals 1 or not.

```
13.3.2 Properties
```

Tests wether an exercise property with the name  $\langle property \rangle$  is defined.

Tests wether the exercise property  $\langle property \rangle$  has been set for the current exercise.

```
\GetExerciseProperty{\langle property\rangle}
```

Retrieves the value of the property  $\langle property \rangle$  for the current exercise.

```
\GetExerciseProperty TF \{\langle property \rangle\} \{\langle true \rangle\} \{\langle false \rangle\}
```

Tests wether the exercise property  $\langle property \rangle$  has been set for the current exercise. Inside the  $\langle true \rangle$  branch you can refer to the retrieved value either with #1 or with \PropertyValue. This command expands its contents inside a group.

```
\GetExerciseBody{exercise|solution}
```

Retrieves the emvironment body of either the exercise or the corresponding solution of the corresponding solution of the

```
\GetExerciseIdForProperty{\langle property\rangle}{\langle value\rangle}
```

Retrieves the property id of the exercise where the property  $\langle property \rangle$  has the value  $\langle value \rangle$ . *This only works for* unique *properties!* 

```
\GetExerciseTypeForProperty{\langle property\rangle}{\langle value\rangle}
```

Retrieves the property type of the exercise where the property  $\langle property \rangle$  has the value  $\langle value \rangle$ . *This only works for* unique *properties!* 

```
\SetExerciseProperty{\langle property\rangle}{\langle value\rangle}
```

Set the property  $\langle property \rangle$  of the current exercise to  $\langle value \rangle$ .

```
\SetExpandedExerciseProperty{\langle property\rangle} \{\langle value\rangle}
```

Expand (malue) Andef-like and set the property (property) of the current exercise to the result of the expansion.

```
\ExerciseSetProperty{\langle type \rangle}{\langle id \rangle}{\langle property \rangle}{\langle value \rangle}
```

Set: the property of the exercise of type  $\langle type \rangle$  and id  $\langle id \rangle$  to  $\langle value \rangle$ . (Jun 20, 2017)

#### $\ExerciseSetExpandedProperty{\langle type \rangle}{\langle id \rangle}{\langle property \rangle}{\langle value \rangle}$

Expand  $\ll$  to  $\ensuremath{\text{Nodef}}$ -like and set the property  $\ensuremath{\text{property}}$  of the exercise of type  $\ensuremath{\text{type}}$  and id  $\ensuremath{\text{H}}$  if  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{property}}$  of the exercise of type  $\ensuremath{\text{type}}$  and id  $\ensuremath{\text{H}}$  if  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{property}}$  of the exercise of type  $\ensuremath{\text{type}}$  and id  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{type}}$  of the exercise of type  $\ensuremath{\text{type}}$  and id  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{type}}$  of the exercise of type  $\ensuremath{\text{type}}$  and id  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{type}}$  of the exercise of type  $\ensuremath{\text{type}}$  and  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}}$  is a set the property  $\ensuremath{\text{H}}$  in  $\ensuremath{\text{H}$  is a set the property  $\ensure$ 

## $\Time Text{If Exercise Boolean Property TF} {\langle property \rangle} {\langle true \rangle} {\langle false \rangle}$

Checks wether the boolean property  $\langle property \rangle$  has value true or  $\langle false \rangle$  and leaves the corresponding argument in the input stream. Gives an error if  $\langle property \rangle$  is not a boolean property.

#### \GetExerciseAliasP\*roperty{⟨property⟩}

Retrieves the value of the property of which  $\langle property \rangle$  is an alias of for the current exercise.

## $\SaveExerciseProperty{\langle property\rangle}{\langle macro\rangle}$

Saves the value of the property  $\langle property \rangle$  for the current exercise in macro  $\langle macro \rangle$ .

### **\GlobalSaveExerciseProperty**

Globally saves the value of the property  $\langle property \rangle$  for the current exercise in macro  $\langle macro \rangle$ .

## 

Test if the property  $\langle property \rangle$  has been set for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$ .

## $\ExercisePropertyGet{\langle type \rangle}{\langle id \rangle}{\langle property \rangle}$

Retrieves the value of the property  $\langle property \rangle$  for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$ .

# $\verb|\ExercisePropertyGetAlias|{\langle type\rangle}|{\langle id\rangle}|{\langle property\rangle}|$

Retrieves the value of the property of which  $\langle property \rangle$  is an alias of for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$ .

#### $\ExercisePropertySave{\langle type \rangle}{\langle id \rangle}{\langle property \rangle}{\langle macro \rangle}$

Saves the value of the property  $\langle property \rangle$  for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$  in macro  $\langle macro \rangle$ .

#### $\ExercisePropertyGlobalSave{\langle type \rangle}{\langle id \rangle}{\langle property \rangle}{\langle macro \rangle}$

Globally saves the value of the property  $\langle property \rangle$  for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$  in macro  $\langle macro \rangle$ .

#### 13.3.3 Parameters

#### \GetExerciseParameter{\( \nabla parameter \) \}

Retrieves the value of the parameter *(paramater)* for the current exercise type.

## $\GetExerciseParameterTF\{\langle parameter\rangle\}\{\langle true\rangle\}\{\langle false\rangle\}$

Retrieves the value of the parameter (parameter) for the current exercise type. Inside the (#400) Branch you can refer to the retrieved value either with #1 or with \ParameterValue. This command expands its contents inside a group.

#### \GetExerciseName \*

Retrieves the value of the parameter exercise-name for the current exercise or of the parameter solution-name for the current solution.

### $\GetExerciseHeadingF\{\langle false \rangle\}\$

Retrieves the value of the parameter exercise-heading for the current exercise or of the parameter) solution-heading for the current solution. Inserts  $\langle false \rangle$  if the corresponding parameter has not been set.

#### $\ExerciseParameterGet{\langle type \rangle}{\langle parameter \rangle}$

Retrieves the value of the parameter  $\langle parameter \rangle$  for the exercise of type  $\langle type \rangle$  with id  $\langle id \rangle$ .

Testoifuthe parameter (parameter) has been set for the current exercise type.

(Jun 20, 2017)

```
\ExerciseParameterIfSetTF{\langle type \rangle} {\langle parameter \rangle} {\langle true \rangle} {\langle false \rangle}
```

Testoifuthe iparameter  $\langle parameter \rangle$  has been set for the exercise type  $\langle type \rangle$ . (Jun 20, 2017)

13.3.4 Tags

## $\ForEachExerciseTag{\langle type \rangle} {\langle code \rangle}$

Loops over all tags of tag type  $\langle type \rangle$  for the current exercise applying  $\langle code \rangle$  each time. Inside  $\langle code \rangle$  you can refer to the corresponding tag with #1.

## $\ListExerciseTags{\langle type \rangle}{\langle between \rangle}$

Lists all tags of tag type  $\langle type \rangle$  for the current exercise using  $\langle between \rangle$  as a separator.

```
\UseExerciseTags{\langle type \rangle}{\langle between\ two \rangle}{\langle between \rangle}{\langle between\ last\ two \rangle}
```

Lists all tags of tag type  $\langle type \rangle$  for the current exercise using  $\langle between \rangle$  as a separator and  $\langle between \ last \ two \rangle$  as separator between the last two tags of the list. If the list only consists of two tags  $\langle between \ two \rangle$  is used as separator.

```
\IfExerciseTagSetTF{\langle value \rangle} {\langle true \rangle} {\langle false \rangle}
```

In order trodinsertitext (also *outside* of exercises) depending on the chosen tags this command lets but check if value (*value*) has been set for tags.

```
\IfExerciseTopicSetTF{\langle value \rangle} {\langle true \rangle} {\langle false \rangle}
```

In order to insertitext (also outside of exercises) depending on the chosen tags this command lets but check if value (value) has been set for topics.

13.3.5 Further Commands for Usage in Template Definitions

```
\UseExerciseTemplate{\langle type \rangle} {\langle name \rangle}
```

Retrieve template  $\langle name \rangle$  of type  $\langle type \rangle$ . This can be useful if you want to define a template which just adds some code to an existing template (an automated \label, say).

#### \ExerciseType

Can be used to refer to the current exercise type.

#### **\ExerciseID**

Can be used to refer to the current exercise id.

#### \ExerciseText

Can be used inside solutions to retrieve the text of the corresponding solution. This is propably seldom useful as in most use cases the exercise property solution is the easier alternative.

#### \ExerciseCollection

Can be used in certain templates to refer to the collection that is currently inserted.

#### \numberofusedexerc\*ises

Holds the total number of used exercises. Useful in table template definitions.

#### \ExerciseTableType $\{\langle code \rangle\}$

In table template definitions this macro either expands to the given exercise type or – if no type has been given – to  $\langle code \rangle$ .

#### $\IfInsideSolutionTF{\langle true \rangle} {\langle false \rangle}$

Tests if the template is used inside a solution environment or not.

### $\IfSolutionPrintTF{\langle true \rangle} {\langle false \rangle}$

Tests if the option print for the solutions of the current \ExerciseType is set to true or false.

## $\IfExistSolutionTF{\langle true \rangle} {\langle false \rangle}$

Testsdifeadsolution for the current exercise exists.

(Jun 20, 2017)

#### $\ForEachPrintedExerciseByType{\langle code \rangle}$

Loops over each *printed* exercise ordered by the exercise types and within each type by id. Inside  $\langle code \rangle$  you can refer to several properties of the corresponding exercise:

- •#1: the type of the exercise
- •#2: the id of the exercise
- •#3: the counter property of the exercise
- •#4: the subtitle property of the exercise
- •#5: the points property of the exercise
- •#6: the bonus-points property of the exercise

#### $\TorEachUsedExerciseByType{\langle code \rangle}$

Loops over each used exercise ordered by the exercise types and within each type by id. Inside  $\langle code \rangle$  you can refer to several properties of the corresponding exercise:

- •#1: the type of the exercise
- •#2: the id of the exercise
- •#3: the counter property of the exercise

- •#4: the subtitle property of the exercise
- •#5: the points property of the exercise
- •#6: the bonus-points property of the exercise

#### $\ForEachPrintedExerciseByID{\langle code \rangle}$

Loops over each *printed* exercise order by the exercise id. Inside  $\langle code \rangle$  you can refer to several properties of the corresponding exercise:

- •#1: the type of the exercise
- •#2: the id of the exercise
- •#3: the counter property of the exercise
- •#4: the subtitle property of the exercise
- •#5: the points property of the exercise
- •#6: the bonus-points property of the exercise

#### $\ForEachUsedExerciseByID{\langle code \rangle}$

Loops over each *used* exercise order by the exercise id. Inside  $\langle code \rangle$  you can refer to several properties of the corresponding exercise:

- •#1: the type of the exercise
- •#2: the id of the exercise
- •#3: the counter property of the exercise
- •#4: the subtitle property of the exercise
- •#5: the points property of the exercise
- •#6: the bonus-points property of the exercise

# $XSIMprint{exercise | solution}{\langle type \rangle}{\langle id \rangle}$

Inserts the either the exercise or the solution of type  $\langle type \rangle$  with the id or ID  $\langle id \rangle$ . changed with version 0.17

#### $XSIMXprime{exercise|solution}{\langle type \rangle}{\langle id \rangle}$

The same as \XSIMprint but expands  $\langle type \rangle$  and  $\langle id \rangle$  before it uses them. Introduced in version 0.16, changed with version 0.17 \XSIMtranslate{ $\langle keyword \rangle$ }

Delivers the translation of \( \lambda keyword \rangle \) according to the current document language (in the meaning of a babel [pkg:babel] or polyglossia [pkg:polyglossia] language). Existing keywords and keyword translations (and how to add new ones) are explained in section ??.

#### $XSIMexpandcode{\langle code \rangle}$

Expands (code) like \edef does and leaves the result in the input stream.

#### $XSIMifchapterTF{\langle true \rangle} \{\langle false \rangle\}$

Returns  $\langle true \rangle$  if both a macro \chapter and a counter chapter are defined and  $\langle false \rangle$  otherwise.

#### $XSIMmixedcase{\langle code \rangle}$

Converts the full expansion  $\circ$  of  $\langle code \rangle$  to mixed case:

\XSIMmixedcase{this is some text} This is some text

This command expands (code) before converting it.

#### $XSIMputright\langle macro \rangle \{\langle code \rangle\}$

```
XSIMifeqTF{\langle code 1 \rangle} {\langle code 2 \rangle} {\langle true \rangle} {\langle false \rangle}
```

Checks if the full expansion of  $\langle code 1 \rangle$  and  $\langle code 2 \rangle$  is the same tokenlist.

```
\XSIMifblankTF{\langle code \rangle} {\langle true \rangle} {\langle false \rangle}
```

Checks if the full expansion  $^{0}$  of  $\langle code \rangle$  is blank (*i. e.*, if it is empty or only consists of spaces).

```
XSIMatbegindocument{\langle code \rangle}
```

Adds: (code) do x sina's begin document hook. Should be used inside style files instead of AtBeginDocument.

#### $XSIMatenddocument{\langle code \rangle}$

Adds: (acads) etgox6134's end document hook. Should be used inside style files instead of AtEndDocument.

# 13.4 Declaring Templates

13.4.1 Environment Templates

```
\DeclareExerciseEnvironmentTemplate{\langle name \rangle} {\langle begin\ code \rangle} {\langle end\ code \rangle}
```

Declare the environment template  $\langle name \rangle$ .

Environment templates are used by the exercise and solution environments. Those are the templates set with the parameters exercise-template and solution-template.

The predefined template is called "default", see section ??.

13.4.2 Heading Templates

```
\DeclareExerciseHeadingTemplate{\langle name \rangle} {\langle code \rangle}
```

Declare the heading template  $\langle name \rangle$ .

Heading templates are used by \printsolutions, \printsolutionstype and \printcollection. Those are the templates set with the option headings-template of the modules print-solutions and print-collection.

The predefined templates are "default", "collection", "per-section" and "per-chapter" see section ??.

<sup>9.</sup> This is a \romannumeral expansion [texsx:romannumeral].

#### 13.4.3 Grading Table Templates

```
\DeclareExerciseTableTemplate{\langle name \rangle} {\langle code \rangle}
```

Declare the grading table template  $\langle name \rangle$ .

Table templates are used by \gradingtable. Those are the templates set with the option template of module grading-table

The predefined templates are "default" and "default\*", see sections ?? and ??.

#### 13.5 Create and Use XSIM Style Files

xsim officingeryou descripossibility to create own style files. Let's say you want to have a style called ଲିଆଧାର ବିନୟ ବ୍ୟର୍ଥଲ. Then you need to save all necessary definitions in a file called:

```
xsim.style.math-exam.code.tex
```

The first command in the file should be \xsimstyle{math-exam}. This file can now be loaded into your document using \loadxsimstyle{math-exam} or by using \xsimsetup{load-style=math-exam}:

```
1 \documentclass[DIV=18,parskip=half]{scrartcl}
2 \usepackage[T1]{fontenc}
3 \usepackage[utf8]{inputenc}
4
5 \usepackage[clear-aux]{xsim}
6 \loadxsimstyle{math-exam}
7
8 \title{Math Exam \#3}
9 \date{2017-03-28}
```

In this style file stuff like template and property definitions should happen. This is more or less a convenient way to

- · keep the preamble "clean" and
- define re-usable styles without the need of copying the document preamble to another document.

A style file is like a package or class file, *i. e.*, @ has category code 11 (letter). The formal description of the commands:

```
\xsimstyle*{\langle style name\rangle}
```

The first command in a xsim style file called xsim.style. (style name).code.tex which defines the xsim style (style name). The starred version activates expl3 syntax. 10

```
\label{loadxsimstyle} \csv\ list\ of\ style\ names \
```

Load one or more styles into the document.

<sup>10.</sup> Those users who want this will know what it means. If you don't know what it means you will not need it.

```
load-style = {\langle csv | list | of style | names \rangle}
Another interface fore kloadx simstyle {\langle csv | list | of style | names \rangle}.

(Oct 13, 2019)
```

At the moment this mechanism offers no advantages over creating a custom package or simply \inputing a file. Future versions might provide additional features.

#### 13.6 Examples

The repository of this package "1 currently includes 40 example documents demonstrating how different aspects of this package work or how different kinds of problems can be solved or how different kinds of layouts can be achieved as well as how solve concrete problems that have come up in different LaTeX forums, see section ??.

#### 13.6.1 The default Exercise Template

Below the definition of https:// exercise template provided by XSIM is shown:

```
(Oct 13, 2019)
1 \DeclareExerciseEnvironmentTemplate{default}{%
    \GetExerciseHeadingF{\subsection*}%
      \XSIMmixedcase{\GetExerciseName}\nobreakspace
      \GetExerciseProperty{counter}%
      \IfInsideSolutionF
        {%
          \GetExercisePropertyT{subtitle}
            { {\normalfont\itshape\PropertyValue}}%
        }%
    }
11
    \GetExercisePropertyT{points}
12
13
        \marginpar
14
          {%
15
            \IfInsideSolutionF{\rule{1.2cm}{1pt}\slash}%
16
            \printgoal{\PropertyValue}
17
            \GetExercisePropertyT{bonus-points}{~(+\printgoal{\PropertyValue})
            ~\XSIMtranslate {point-abbr}%
19
          }%
20
      }%
21
23 {\par}
```

<sup>11.</sup> GitHub: https://github.com/cgnieder/xsim/, CTAN: http://www.ctan.org/pkg/xsim/

#### 13.6.2 A New Exercise Type Using tcolorbox

Let's say we want exercises to be put in a tcolorbox. We want a bold title and. if given, an italic subtitle. Exercises should also have the points after the subtitle in parentheses if given. Let's also say we want those to be an additional exercise type in addition to the ones **xsim** already provides. This is shown with the following code which is also how the problems in this manual have been defined:

```
1 \DeclareExerciseEnvironmentTemplate{tcolorbox}
    {%
      \tcolorbox[
        colback = red!5!white ,
        colframe = red!75!black ,
        colbacktitle = yellow!50!red ,
        coltitle = red!25!black ,
        breakable,
        drop shadow,
        beforeafter skip = .5\baselineskip ,
        title =
11
          \textbf{\GetExerciseName~\GetExerciseProperty{counter}}%
          \GetExercisePropertyT{subtitle}{ \textit{\PropertyValue}}%
13
          \IfInsideSolutionF{%
14
            \GetExercisePropertyT{points}{ % notice the space
15
                \printgoal{\PropertyValue}
17
                \IfExerciseGoalSingularTF{points}
                   {\XSIMtranslate{point}}
                   {\XSIMtranslate{points}}%
              )%
            }%
22
          }%
23
      ]%
25
    {\endtcolorbox}
26
28 \DeclareExerciseType{problem}{
    exercise-env = problem ,
    solution-env = answer ,
    exercise-name = Problem ,
    solution-name = Answer ,
    exercise-template = tcolorbox ,
33
    solution-template = tcolorbox
35 }
```

See it in action:

```
1 \begin{problem}[subtitle=My subtitle,points=5]
2 This is a problem using a subtitle and points.
3 \end{problem}
4 \begin{answer}
5 This is the answer to problem~\GetExerciseProperty{counter}.
6 \end{answer}
```

## 13.6.3 Mimicking exsheets' runin Template

The following example shows how you could mimick exsheets' runin template. The outcome isn't exactly the same since exsheets doesn't use \marginpar but the result should look very similar. A safer definition would use a real sectioning command for the title.

```
1 \usepackage{needspace}
2 \DeclareExerciseEnvironmentTemplate{runin}
      \par\vspace{\baselineskip}
      \Needspace*{2\baselineskip}
      \textbf{\XSIMmixedcase{\GetExerciseName}~\GetExerciseProperty{counter}}%
      \GetExercisePropertyT{subtitle}{ \textit{#1}} % <<< notice the space
      \IfInsideSolutionF{%
        \GetExercisePropertyT{points}{%
10
          \marginpar{%
11
            \printgoal{\PropertyValue}%
            \GetExercisePropertyT{bonus-points}{+\printgoal{\PropertyValue}}%
13
            \,\IfExerciseGoalSingularTF{points}
                {\XSIMtranslate{point}}
                {\XSIMtranslate{points}}%
17
        }%
18
      }%
19
    }
21
    {}
```

#### 13.6.4 Mimicking exsheets' margin Template

The following example shows how you could mimick exsheets' margin template.

```
1 \DeclareExerciseEnvironmentTemplate{margin}
2 {%
```

```
\trivlist
      \item[\llap{%
        \smash{%
          \tabular[t]{@{}r@{}}
            \textbf{\XSIMmixedcase{\GetExerciseName}~\GetExerciseProperty{
   counter}}
            \IfExercisePropertySetT{points}{%
              \tabularnewline
              (%
                \printgoal{\GetExerciseProperty{points}}%
                \GetExercisePropertyT{bonus-points}{+\printgoal{#1}}%
12
                \,\XSIMtranslate{point-abbr}%
              )%
            }%
15
          \endtabular
        }%
      }]\relax
19
    {\endtrivlist}
```

#### 13.6.5 A minimal Template

This shows the implementation of the minimal template:

```
1 \DeclareExerciseEnvironmentTemplate{minimal}
   {%
      \par
      \textbf{\GetExerciseProperty{counter}}%
      \IfInsideSolutionF{%
        \GetExercisePropertyT{points}{%
          \GetExercisePropertyT{bonus-points}{+\printgoal{\PropertyValue}}%
          \,\IfExerciseGoalSingularTF{points}
              {\XSIMtranslate{point}}
              {\XSIMtranslate{points}}%
        }%
11
      }%
12
   }
13
    {\par}
```

## 13.6.6 The Headings Templates

**XSIM** defines four heading templates which only differ by which text they output:

```
1 \DeclareExerciseHeadingTemplate{default}
2 {\section*{\XSIMtranslate{default-heading}}}
3 \DeclareExerciseHeadingTemplate{collection}
4 {\section*{\XSIMtranslate{collection-heading}}}
5 \DeclareExerciseHeadingTemplate{per-section}
6 {\section*{\XSIMtranslate{per-section-heading}}}
7 \DeclareExerciseHeadingTemplate{per-chapter}
8 {\section*{\XSIMtranslate{per-chapter-heading}}}
```

Section ?? shows how the translations are defined.

#### 13.6.7 The default Table Template

This template is the one used for grading tables per default. It has a vertical layout.

```
1 \DeclareExerciseTableTemplate{default}{%
    \XSIMputright\ExerciseTableCode{%
      \toprule
      \XSIMifblankF{\ExerciseType}
        {\XSIMmixedcase{\GetExerciseParameter{exercise-name}}}
      \XSIMmixedcase{\XSIMtranslate{points}} &
      \XSIMtranslate{reached} \\
      \midrule
10
    \ForEachUsedExerciseByType{%
11
      \XSIMifeqT{#1}{\ExerciseTableType{#1}}
13
          \XSIMifblankT{\ExerciseTableType{}}
14
            {%
              \XSIMputright\ExerciseTableCode{%
                \XSIMmixedcase{\ExerciseParameterGet{#1}{exercise-name} }%
              }%
            }%
          \XSIMputright\ExerciseTableCode
            {#3 \& XSIMifblankTF{#5}{\left(0\}}{\left(0\}\right)} \& \ }
21
22
23
    \XSIMputright\ExerciseTableCode{%
24
      \midrule
25
      \XSIMtranslate{total} &
26
      \XSIMifblankTF{\ExerciseType}
        {\TotalExerciseGoal{points}{}{}}
28
        {\TotalExerciseTypeGoal{\ExerciseType}{points}{}}} &
29
      \\ \bottomrule
```

```
31  }%
32  \XSIMexpandcode{%
33     \noexpand\begin{tabular}{\XSIMifblankTF{\ExerciseType}{l}{c}cc}
34     \noexpand\ExerciseTableCode
35     \noexpand\end{tabular}%
36  }%
37 }
```

#### The part

```
1 \XSIMifblankTF{\ExerciseType}{ ... }{ ... }
```

repeatedly checks if an exercise type has been given for the table. This makes it possible to design the table differently if it is for one exercise type only (the true case) or for all exercise types (the false case).  $\ensuremath{\mathsf{ExerciseTableType}} \{ \langle code \rangle \}$  either expands to the given exercise type or to  $\langle code \rangle$ .

#### 13.6.8 The default\* Table Template

The second of the predefined grading table templates. It has a horizontal layout.

If you have a lot of exercises the width of a table with this layout may exceed the text width of the document!

```
1 \DeclareExerciseTableTemplate{default*}{%
    \XSIMputright\ExerciseTableCode{%
      \toprule
      \XSIMifblankF{\ExerciseType}
        {\XSIMmixedcase{\GetExerciseParameter{exercise-name}}}
    }%
    \ForEachUsedExerciseByType{%
      \XSIMifeqT{#1}{\ExerciseTableType{#1}}
10
          \XSIMifblankT{\ExerciseTableType{}}
11
            {%
              \XSIMputright\ExerciseTableCode{%
13
                \XSIMmixedcase{\ExerciseParameterGet{#1}{exercise-name} }%
              }%
            }%
          \XSIMputright\ExerciseTableCode{#3 &}
17
18
   }%
```

```
\XSIMputright\ExerciseTableCode{%
      \XSIMtranslate{total} \\
21
      \midrule
22
     \XSIMmixedcase{\XSIMtranslate{points}} &
23
    }%
24
    \ForEachUsedExerciseByType{%
25
      \XSIMifeqT{#1}{\ExerciseTableType{#1}}
26
27
          \XSIMputright\ExerciseTableCode{%
28
            29
        }%
30
    }%
31
    \XSIMputright\ExerciseTableCode{%
32
     \XSIMifblankTF{\ExerciseType}
33
        {\TotalExerciseGoal{points}{}{}}
34
        {\TotalExerciseTypeGoal{\ExerciseType}{points}{}}%
      \\ \midrule
      \XSIMtranslate{reached} &%
37
38
    \ForEachUsedExerciseByType{%
     \XSIMifeqT{#1}{\ExerciseTableType{#1}}
        {\XSIMputright\ExerciseTableCode{&}}%
41
42
    \XSIMputright\ExerciseTableCode{ \\ \bottomrule }%
    \edef\numberofcolumns{%
44
     \XSIMifblankTF{\ExerciseType}
45
        {\numberofusedexercises}
46
        {\csname numberof \ExerciseType s\endcsname}%
47
48
    \XSIMifeqF{\numberofcolumns}{0}
49
50
        \begin{tabular}{l*{\numberofcolumns}{c}c}c
51
          \ExerciseTableCode
52
        \end {tabular}%
53
55 }
```

#### The part

```
1 \XSIMifblankTF{\ExerciseType}{ ... }{ ... }
```

repeatedly checks if an exercise type has been given for the table. This makes it possible to design the table differently if it is for one exercise type only (the true case) or for all exercise types (the false case).  $\ensuremath{\mathsf{ExerciseTableType}} \{ \langle code \rangle \}$  either expands to the given exercise type or to  $\langle code \rangle$ .

# 14 Exercise Translations

```
\DeclareExerciseTranslation{\langle language \rangle}{\langle keyword \rangle}{\langle translation \rangle}
Declare the translation of \langle keyword \rangle for language \langle language \rangle.
```

```
\DeclareExerciseTranslations\{\langle keyword\rangle\}\{\langle translations\rangle\}\
```

Declare the translations of  $\langle keyword \rangle$  for several languages at once. See an example of the usage below.

#### $XSIMtranslate{\langle keyword \rangle}$

Delivers the translation of  $\langle keyword \rangle$  according to the current document language (in the meaning of a babel [**pkg:babel**] or polyglossia [**pkg:polyglossia**] language).

#### $\ForEachExerciseTranslation{\langle code \rangle}$

Loops over all translations of all keywords known to **xsim**. Inside  $\langle code \rangle$  you can refer to the keyword with #1, to the language with #2, and to the translation with #3.

As an example how to use \DeclareExerciseTranslations here is how the translations for exercise have been defined:

Table ?? shows all existing keywords with all predefined translations.

TABLE 1: Translation keywords predefined by XSIM.

# 15 Cloze Tests and Blank Lines

Similar to exsheets **XSIM** provides a command **\blank**:

```
\mathbf{blank} * [\langle options \rangle] {\langle text \ to \ be \ filled \ in \rangle}
```

a paragraph.

Creates a blank in normal text or in an exercise but fills the text of its argument if inside a solution. If used at the *begin of a paragraph* \blank will do two things: it will set the linespread according to an option explained below and will insert \par after the lines. The starred version doesn't do these things.

Those are the options for customization:

```
blank-style = \{\langle code \rangle\}
                                               blank/
                                                                                Default: \underline{#1}
  Instructions for typesetting the blank cloze. Refer to the filled in space with #1.
filled-style = \{\langle code \rangle\}
                                                                                Default: \underline{#1}
                                                blank/
  Instructions for typesetting the filled cloze. Refer to the filled in text with #1
style = \{\langle code \rangle\}
   Shortcut for setting both blank-style and filled-style at once.
scale = \{\langle decimal \ number \rangle\}
                                                                                                  Default: 1
                                                    blank/
   Scales the blank to (decimal number) times its natural width.
                                                                                           (initially empty)
width = \{\langle dim \rangle\}
                                      blank/
   Sets the blank to a width of \langle dim \rangle. This takes precendence over scale.
linespread = \{\langle decimal \ number \rangle\}
                                                           blank/
                                                                                                  Default: 1
   Set the linespread for the blank lines. This only has an effect if \blank is used at the begin of
```

line-increment =  $\{\langle dim \rangle\}$  blank/ Default: 0.001\linewidth The blank line is built in multiples of this value. If the value is too large you may end up

with uneven lines. If the value is too small you may end up with a non-ending compilation. Experiment with values to find the suiting one for your use case.

 $line-minimum-length = \{\langle dim \rangle\}$  blank/ Default: 2em

The minimal length a line must have before it is built step by step.

```
1 This is a \blank{blank} outside in normal text.
2 \begin{exercise}
3    Try to fill in \blank[width=4cm]{these} blanks. All of them
4    \blank{are created} by using the \cs{blank} \blank{command}.
5 \end{exercise}
6 \xsimsetup{blank/filled-style=\textcolor{red}{#1}}
7 \begin{solution}[print]
8    Try to fill in \blank[width=4cm]{these} blanks. All of them
9    \blank{are created} by using the \cs{blank} \blank{command}.
10 \end{solution}
This is a _____ outside in normal text.
```

A number of empty lines are easily created by setting the width option:

<pre>1 Write up the pros and cons of \xsim\ over \pkg{exsheets}: 2 3 \blank[width=4.8\linewidth,linespread=1.5]{}</pre>
Write up the pros and cons of XSIM over exsheets:

#### **A** Future Plans

**XSIM** is complete in so far as it is perfectly usable to create exams or exercise and solution sections in books with the most freedom in layout already. But still there are features which would be useful additions. Below I list all ideas that I currently plan to add to **XSIM**:

• a document class xsim-exam for creating exams; this class should itself feature the possibility of creating different versions of an exam, maybe already provide multiple choice questions and so on; one could also think about automatic creation of running headers and footers, *i. e.*, means for changing the layout of the exam; following the spirit of XSIM this should probably be done using templates as well.

I am very open to suggestions regarding features, both in general and specifically regarding the document class.

# **B** FAQ & How to...

This section serves as a kind of gallery showing solutions to common problems. I expect this section to grow over the years. Some examples especially regarding other layouts are also shown in example files added to this package.

## **B.1** ... Know if **XSIM** Needs Another Compilation?

If **XSIM** wants you to recompile your document it writes the following to the logfile:

So just check the logfile regularly (which you should be doing anyway) and keep your eyes open.

# **B.2** ... Resolve Getting Repeatedly Wrong Exercise Properties or Wrong Exercise Lists?

xsim writes a lot of stuff to an auxiliary file called \jobname.xsim (or the common \jobname.aux if you use option use-aux) for re-using information on subsequent compilations. If you add exercises, change properties etc. it might happen that wrong information is staying in the auxiliary file and is wrongly used by xsim. In such cases deleting the auxiliary file and doing a few fresh compilations may resolve your problems.

Sometimes the *existence of exercise or solution files from earlier compilations* may lead to wrong lists of exercises or solutions. In such cases it can be useful to delete all those files and doing a fresh compilation. It may be helpful to use a subfolder for those exernal files which will make deleting them a little bit easier. (Don't forget to both create the subfolder and set path accordingly then.)

Using the clear-aux option might help to reduce erroneous exercises.

#### **B.3** ... Resolve Strange Errors After Updating?

**XSIM** writes a lot of stuff to the auxiliary file. An update may well change how this is done so deleting the auxiliary file and doing a few fresh compilations may resolve your problems.

# **B.4**! TeX capacity exceeded, sorry [text input levels=15]. Why?

Did you try to use an exercise or solution in a macro of some sort? This generally will fail.<sup>12</sup> But there should never be the need to hide the environments inside of a macro, anyway.

#### B.5 Runaway argument? !File ended while scanning use of ^^M. Why?

Did you try to use an exercise or solution in a macro of some sort? This generally will fail. But there should never be the need to hide the environments inside of a macro, anyway.

# **B.6** ... Put a Star (or Another Symbol) in Headings of Exercises That Are Special?

The code below shows one possible modification of an exercise template which allows to easily create bonus exercises:

```
1 % preamble:
2 \usepackage{amsymb}
3 % declare boolean property:
4 \DeclareExerciseProperty*{bonus}
5 \DeclareExerciseEnvironmentTemplate{bonus}
      \subsection*
        {%
          % test for boolean property and insert star symbol if true:
          \IfExerciseBooleanPropertyT{bonus}{\llap{$\bigstar$}Bonus}%
          \XSIMmixedcase{\GetExerciseName}\nobreakspace
          \GetExerciseProperty{counter}%
12
          \IfInsideSolutionF
            {%
              \IfExercisePropertySetT{subtitle}
15
                { {\normalfont\itshape\GetExerciseProperty{subtitle}}}%
16
            }%
17
        }
      \GetExercisePropertyT{points}
19
        {%
20
          \marginpar
21
            {%
              \IfInsideSolutionF{\rule{1.2cm}{1pt}\slash}%
23
              \PropertyValue
              \GetExercisePropertyT{bonus-points}
                {\nobreakspace(+\PropertyValue)}%
              \nobreakspace\XSIMtranslate{point-abbr}%
27
            }%
28
        }%
```

<sup>12.</sup> The reasons are similar to the ones given here: https://tex.stackexchange.com/a/295422/.

```
30 }
31 {}
```

The usage is now as follows:

```
1 \xsimsetup{exercise/template = bonus}
2 % set the boolean property to true
3 \begin{exercise}[bonus]
4          A bonus question.
5 \end{exercise}
```

## **B.7** ... Print All Solutions Grouped by Section?

Here is an idea how to get a list of all solutions grouped by the section the corresponding exercises are appearing in.

```
1 % preamble:
2 % \usepackage{etoolbox}
3 % \newcounter{sections}
4
5 % document:
6 \setcounter{sections}{1}
7 \whileboolexpr
8 { test {\ifnumless{\value{sections}}}{\value{section}+1}} }
9 {
10 \printsolutions[section=\value{sections}, headings-template=per-section]
11 \stepcounter{sections}
12 }
```

For this manual we then get the following list.<sup>13</sup>

# C The xsimverb package

xsim comes bundled with another package called xsimverb. This package loads a very small subset of xsim which allows to create environments that wffte their contents verbatim to external files. It provides the following commands (which of course are also available in xsim, too):

<sup>13.</sup> Taking care of the fact that we're in the appendix now which means we can't use \value{section}. Therefore this manual does \edef\lastsection{\arabic{section}} right before \appendix

#### \XSIMfilewritestart\*{\langle file name\rangle}

Start writing to the file named \( \file name \). This should be the \( last \) command in the \( begin \) definition of an environment. If is is used in an environment with arguments where the \( last \) argument is optional you should check if the optional argument is given and use the starred version if the test is negative. This is demonstrated in an example below using xparse's \( \text{NewDocumentEnvironment}. \) If you want an environment with only an optional argument you should use xparse's commands to define it. Due to the way how \( \text{newenvironment} \) scans for optional arguments you'll otherwise may end up with leading spaces gobbled from the first line in your environment.

#### \XSIMfilewritestop

Stop writing to the file. This should be the *first* command in the *end* definition of an environment.

#### $XSIMsetfilebegin{\langle code \rangle}$

This command can be used to write something to the external file *before* the environment contents. Must be set before \XSIMfilewritestart in the *begin* definition.

#### $XSIMsetfileend{\langle code \rangle}$

This command can be used to write something to the external file *after* the environment contents. Must be set before \XSIMfilewritestart in the *begin* definition.

#### \XSIMgobblechars{\langle integer\rangle}

Determines how many characters are cut off of the beginning of each line of the environment body before it is written to the file. The default value is 0.

The following code shows an example of how to use those commands:

```
\documentclass{article}
vusepackage{xsimverb, listings}
4 \makeatletter
5 \NewDocumentEnvironment{example}{o}
      \XSIMsetfilebegin{\@percentchar\space file `\jobname.tmp'}%
      \XSIMsetfileend{\@percentchar\space bye bye}%
      \IfNoValueTF{#1}
        {\XSIMfilewritestart*{\jobname.tmp}}
10
        {\XSIMfilewritestart{\jobname.tmp}}%
11
    }
13
      \XSIMfilewritestop
14
      \lstinputlisting[language={[LaTeX]TeX}]{\jobname.tmp}%
      \input{\jobname.tmp}
17
18 \makeatother
```

```
begin{document}

begin{example}

begin{example}

bla bla \LaTeX

end{example}

black

character

characte
```

The tmp file produced by the above example will contain the following three lines (if the file itself was called test.tex):

```
1 % file `test.tmp'
2 bla bla \LaTeX
3 % bye bye
```

# **D** All Exercise Examples

You will notice that some exercises from section ?? look differently in this section. That is because all exercises of a type use the template that's *currently active*. If you want exercises with a different look you should use different exercises types.

The following list is created with this code:

```
1 \xsimsetup{exercise/template = bonus}
2 \printcollection[headings]{all exercises}
```

#### Exercise 1

A first example for an exercise.

#### **Exercise 2** This is a subtitle

An exercise where some properties have been set.

#### Exercise 3

```
\GetExerciseProperty{id}: 3
\GetExerciseAliasProperty{ID}: 3
\GetExerciseProperty{ID}: 3
```

# Exercise 4

```
\GetExerciseProperty{id}: 4
\GetExerciseAliasProperty{ID}: 4
\GetExerciseProperty{ID}: foo-bar
```

#### Exercise 5

This exercise will not be printed but the exercise counter will be incremented nonetheless. Its solution will be printed in the list of solutions.

#### Exercise 7

This exercise is added to the collection 'foo'.

#### **Exercise 8**

This exercise is also added to the collection 'foo'.

#### Exercise 9

So is this.

#### Exercise 10

As well as this one.

#### **Exercise 6** The Subtitle

Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Ut purus elit, vestibulum ut, placerat ac, adipiscing vitae, felis. Curabitur dictum gravida mauris. Nam arcu libero, nonummy eget, consectetuer id, vulputate a, magna. Donec vehicula augue eu neque. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Mauris ut leo. Cras viverra metus rhoncus sem.

\_/2.5 p

_	•	
Exe	rcise	11

Try to fill in	 blanks.	All of them	 by	using	the	<b>\blank</b>

#### ★ Bonus Exercise 12

A bonus question.

#### **Problem 1** My subtitle (5 points)

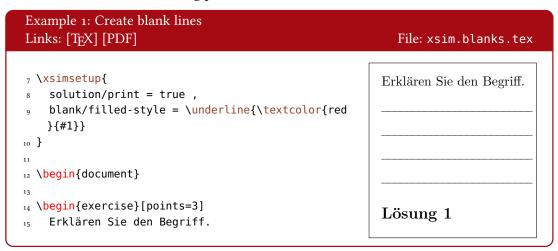

This is a problem using a subtitle and points.

# **E** All Solution Examples

# F Example Documents Coming With This Package

The repository of this package <sup>14</sup> currently includes 40 example documents demonstrating how different aspects of this package work or how different kinds of problems can be solved or how different kinds of layouts can be achieved as well as how to solve concrete problems that have come up in different LaTeX forums.

Besides showing excerpts of the code and the resulting pdf the examples below also link to both the tex source the resulting pdf.
